

Abstract

The purpose of this study was to determine the effect of a 6-week training program on the physical fitness and performance of young women. The subjects were 18 female college students who participated in a supervised exercise program consisting of three sessions per week. The program included cardiovascular endurance, strength, and flexibility exercises. Physical fitness was assessed using a variety of tests, including a 1-mile run, a 10-minute step test, a sit-and-reach test, and a handgrip strength test. Performance was assessed using a series of tasks that simulated activities of daily living, such as carrying groceries, climbing stairs, and lifting objects. Data were collected at baseline and after the 6-week program. Results showed significant improvements in all measures of physical fitness and performance. The 1-mile run time decreased by 1 minute and 30 seconds, the 10-minute step test score increased by 15 steps, the sit-and-reach distance increased by 2 inches, and the handgrip strength increased by 10 pounds. These findings suggest that a 6-week training program can effectively improve the physical fitness and performance of young women.

Keywords: physical fitness, performance, young women, exercise program.
